I. PURPOSE:
To define standards of care for Diabetes Management for eligible members of the Denver Health Medical Plan, Inc. (DHMP)

II. POPULATION:
All enrolled adult members with diagnosis of Diabetes Mellitus from a licensed healthcare provider. Members will be identified through administrative databases such as pharmacy (all members on oral hypoglycemic agents or insulin), claims, and case management databases as well as the Denver Health Diabetes Registry.

A. Criteria for Diagnosis of Diabetes (ADA, 2018):
   - Fasting (no caloric intake for at least 8 hours) Plasma Glucose ≥126 mg/dL* OR
   - 2-hour plasma glucose ≥200 mg/dL during 75-g oral glucose tolerance test* OR
   - A1C ≥6.5% (performed in a laboratory with NGSP certified method)* OR
   - Random plasma glucose ≥220 mg/dL in patients with classic symptoms of hyperglycemia or hyperglycemic crisis

*In absence of unequivocal hyperglycemia, results should be confirmed by repeat testing
For further discussion or clarification please refer to “Classification and Diagnosis of Diabetes: Standards of Medical Care in Diabetes-2018 http://care.diabetesjournals.org/content/41/Supplement_1/S13

B. Exclusions:
1. Pregnancy.
2. Acute process not resulting in need for long term management of diabetes such as steroid-induced or polycystic ovarian syndrome requiring glucose control but not having chronic diabetes diagnosis.

III. RESPONSIBILITY:
The diabetes management team should be multidisciplinary and include the patient as well as providers, nurses, dietitians, pharmacists, diabetes educators, mental health professionals, health coaches, patient navigators, social workers, etc. The goal is to enable individuals to self-manage their diabetes.

IV. IMPROVING CARE AND PROMOTING HEALTH IN POPULATIONS:
Utilizing the chronic care model, the goal is to deliver patient centered collaborative care to enable individuals to self-manage their diabetes. Patient-centered communication should incorporate patient preference, assess literacy and numeracy, and address cultural barriers. Care should also include a comprehensive plan to reduce cardiovascular disease risk.

NOTE:
This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinicians judgment or to establish a protocol for all patients with a particular condition.
V. GUIDELINE:
The following guidelines are consistent with the 2018 Standards of Medical Care in Diabetes from the American Diabetes Association (ADA). Some specifications for HEDIS measures of diabetes care are incorporated. Denver Health recommends a check-up for diabetes management every 6 months if at goal on measures, and every 3 months if not at goal.

A. Initial/Comprehensive Medical Evaluation:
   Confirm and classify diabetes diagnosis; evaluate for complications and potential comorbid conditions; review previous treatment and risk factor control; engage patient in formulation of care management plan; develop plan for continuing care

B. Additional tasks as appropriate for Follow-up Visits or Annual Evaluation:
   1. Interval medical history
   3. Physical examination (height, weight, BMI, blood pressure, thyroid palpation
   4. Comprehensive foot exam: Inspection; palpation of pulses; determination of monofilament sensation and 1 additional sensation (proprioception, vibration, pinprick, or ankle reflex.)
   5. Laboratory evaluation:
      o A1C, if results not available within the past 6 months or last 3 months if previous value not at goal.
      o As necessary, lipid profile, liver functions, sport urinary albumin-to-creatinine ratio, serum creatinine and eGFR, and thyroid-stimulating hormone for those with Type-1 diabetes every 3-5 years per ACC-AHA guidelines.
   6. Assess risk for complications, including cardiovascular and micro/macrovascular complications (see additional tab below for further discussion)
   7. Diabetes self-management behaviors: nutrition, psychosocial health, need for referrals, immunizations; or other routine health maintenance screening
   8. Comorbidities: common comorbidities with diabetes may complicate management. The physician and multidisciplinary team will assess and monitor for comorbidities and provide screening/plan interventions as necessary
      o Autoimmune Diseases: Consider screening type 1 diabetes patients for autoimmune thyroid disease and celiac disease
      o Cancer: Diabetic patients are at increased risk of cancers of the liver, pancreas, endometrium, colon/rectum, breast, and bladder. This may result from shared risk factors between diabetes and age, or with diabetes related factors. Patients are encouraged to undergo recommended

NOTE:
This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinicians judgment or to establish a protocol for all patients with a particular condition.
age and sex-appropriate cancer screenings as well as reduce the modifiable risk factors (obesity, inactivity, and smoking).

- Cognitive Impairment/Dementia
- Fatty Liver Disease: Interventions that improve metabolic abnormalities (weight loss, glycemic control, treatment for dyslipidemia, etc.) are also beneficial for fatty liver disease.
- Fractures: Age-specific hip fracture risk is increased in diabetes (both male and female). Type 1 diabetes is associated with an increased risk for osteoporosis. Type 2 diabetes shows an increased risk of fracture despite higher bone mineral density.
- Hearing Impairment
- Obstructive Sleep Apnea
- Periodontal Disease
- Psychosocial Disorders: Regular and consistent screening for anxiety, depression, disordered eating, and serious mental illness. These can impact the patient’s ability to self-manage their diabetes. If screening demonstrates psychosocial impact, initiation of a referral for additional services may be indicated.

C. Lifestyle Management and Care Plan Development/Updates with patient regarding:

1. Diabetes self-management education (DSME) and diabetes self-management support (DSMS):
   All people with diabetes should participate in self-management education and support to assist with obtaining the knowledge, skills, and ability for self-care as well as the behaviors needed for ongoing self-management. These patient-centered tools consider the needs of the individual to improve outcomes and reduce costs. Content may be tailored to prevention as well.

2. Nutrition Therapy: Patient specific-goals include assisting the patient in determining what to eat and following a food plan. Specific dietary recommendations can be accessed at the ADA website.
   a. For overweight and obese type 2 Diabetic patients, modest weight loss can improve glycemic control. Sustaining weight loss is challenging. Referral to other resources may be necessary to help the patient maintain or achieve nutritional goals. For additional information, please refer to http://care.diabetesjournals.org/content/41/Supplement_1/S65

3. Physical Activity:
   a. Children and Adolescents: 60min/day or more of moderate or vigorous activity at least 3 days/week.

NOTE: This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinician's judgment or to establish a protocol for all patients with a particular condition.
b. Adults: 150 minutes or more of moderate to vigorous activity per week, spread over at least 3 days/week unless contraindicated. Flexibility and balance training 2-3/week for older adults with diabetes. 2-3 sessions/week of resistance exercise on nonconsecutive days for adults with type 1C or type 2B diabetes. All adults with diabetes should decrease sedentary behavior.

c. Prevention or Delay of Type 2 Diabetes: At least annual monitoring for development of diabetes for those in which pre-diabetes is suggested along with:
   o Referral to lifestyle intervention program as indicated
   o Consider Metformin therapy for prevention of type 2 diabetes should for those with pre-diabetes, especially with BMI ≥35, aged <60 years, and women with prior gestational diabetes mellitus. Periodic measurement of vitamin B12 levels should be considered in metformin-treated patients

4. Smoking Cessation: advise all patients not to use tobacco. Include screening and cessation counseling as a routine component of care.

5. Psychosocial Issues: screening and follow up regarding attitudes about illness, expectations for management and outcomes, quality of life, and available resources, depression, anxiety, cognitive capacities, etc.

D. Glycemic Targets:
The 2018 ADA update recommends continuous glucose monitoring in all adults with type 1 diabetes who are not meeting glycemic targets, regardless of age.

<table>
<thead>
<tr>
<th>A1C target</th>
<th>HEDIS classification</th>
<th>Frequency of Testing</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;8% *</td>
<td>Good Control</td>
<td>Twice a year if meeting treatment goals with stable glycemic control</td>
</tr>
<tr>
<td>&gt;9%</td>
<td>Poor Control</td>
<td>Quarterly if not meeting treatment goals or with recent changes in therapy</td>
</tr>
</tbody>
</table>

The 2018 ADA position statement considers <7% a reasonable A1C goal for many non-pregnant adults. However, HEDIS classifies good control <8% for most populations, <7% for selected population. Clinical judgement is warranted to determine the appropriate glycemic target based on the needs of the patient.

   o For more details and information, please refer to Glycemic Targets: Standards of Medical Care in Diabetes- 2018 http://care.diabetesjournals.org/content/41/Supplement_1/S55

E. Pharmacologic approaches to Glycemic Treatment (From ADA, 2018):
1. Insulin Therapy for Type 1 diabetes: Most patients should be treated with multiple daily injections of prandial insulin and basal insulin or continuous subcutaneous insulin infusion and use rapid-acting insulin analogs to reduce hypoglycemia risk.

2. Type 2 Diabetes:
   a. Metformin, if not contraindicated and tolerated is the preferred initial agent for treatment. Consider periodic measurement of vitamin B12 levels, especially in those with anemia or peripheral neuropathy.
   b. A patient-centered approach should be used to guide the choice of pharmacologic agents and medication adherence should be a consideration when selecting pharmacologic therapy. Providers should also consider efficacy, hypoglycemia risk, history of atherosclerotic cardiovascular disease, impact on weight, potential side effects, renal effects, delivery method (oral versus subcutaneous), cost, and patient preferences.
   c. If A1C is above target, selection of pharmacologic treatment is based on several factors such as: the presence or absence of established atherosclerotic cardiovascular disease (ASCVD) or chronic kidney disease (CKD); whether or not there is a compelling need to minimize hypoglycemia; and cost. DHMP adheres to the clinical care guidelines specified by Denver Health (DH) Ambulatory Care Services (ACS) in their clinical care guideline, *Diabetes Management for Non-Pregnant Adults in the Outpatient Setting*. Further details can be accessed via [https://doi.org/10.2337/dci18-0033](https://doi.org/10.2337/dci18-0033) titled, *Management of Hyperglycemia in Type 2 Diabetes, 2018* consensus report by the American Diabetes Association (ADA) and the European Association for the Study of Diabetes (EASD).
   d. Reevaluation of the medication regimen and adjustment as needed to incorporate patient factors and regimen complexity is recommended.

F. CVD and Risk Management: Leading cause of morbidity and mortality for those with diabetes; and largest contributor to the costs of diabetes.
   1. Risk factors (hypertension, dyslipidemia, smoking, family history of premature coronary disease, and albuminuria) should be assessed annually.
   2. Blood Pressure Control: ALL patients with hypertension and diabetes should monitor their blood pressure at home to help identify masked hypertension, as well as to improve medication-taking behavior.

<table>
<thead>
<tr>
<th>Goal</th>
<th>Screening</th>
<th>Diagnosis</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;140/90mmHg</td>
<td>Measured at each routine visit</td>
<td>If elevated, confirmed on separate visit/day</td>
</tr>
</tbody>
</table>

*lower BP targets may be appropriate for younger patients, those with albuminuria, and/or those with hypertension and one or more additional ASCVD risk factors if they can be achieved without undue treatment or burden (ADA, 2017).

**NOTE:**
This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinicians judgment or to establish a protocol for all patients with a particular condition.
a. Patients with BP >120/80 should be advised on lifestyle changes (weight loss, diet changes, increased physical activity, etc.) to reduce blood pressure.
b. Patients with confirmed BP >140/90 on 2 occasions: lifestyle therapy + initiation and titration of pharmacological therapy to achieve blood pressure goal unless contraindicated.
c. Patients with confirmed BP >160/100: lifestyle therapy + initiation of titration of 2 drugs to reduce CVD events in patients with diabetes.
d. ACE inhibitor or ARB at the maximum tolerated dose indicated for blood pressure treatment is the recommended first line treatment for hypertension in patients with diabetes and urine albumin-to-creatinine ratio ≥300 mg/g creatinine or UACR 30-299 mg/g creatinine. If one class is not tolerated the other should be substituted.
e. For patients treated with ACE, ARB, or diuretic, serum creatinine/estimated glomerular filtration rate (eGFR) and serum potassium levels should be monitored.
f. For patients with blood pressure >120/80, lifestyle intervention consists of weight loss (if indicated), a DASH-style dietary pattern (low sodium and increased potassium), moderation of alcohol intake, and increased physical activity.

3. Lipid Management: Lipid management is driven by risk status, not LDL-C level.
   a. Lifestyle modification education and recommendations: focus on weight loss (if indicated) diet modification, and increasing physical activity. Intensify lifestyle therapy and optimize glycemic control for patients with elevated triglyceride levels. With triglyceride levels ≥500mg/dL (5.7mmol/L), evaluate for secondary causes and consider medical therapy to reduce the risk of pancreatitis.
   b. Adjust intensity of statin therapy based on individual response to medication.
   c. Patients with diabetes, 40-75 years of age, should be counseled on their risk for a cardiovascular event through a recognized shared decision making aid.

NOTE: This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinician's judgment or to establish a protocol for all patients with a particular condition.
High-Intensity and Moderate-Intensity Statin Therapy (from ADA, 2018)

<table>
<thead>
<tr>

</tbody>
</table>

*In addition to lifestyle therapy.
**CVD risk factors include LDL cholesterol ≥100 mg/dL (2.6 mmol/L), high blood pressure, smoking, and overweight and obesity.
***Overt CVD includes those with previous cardiovascular events or acute coronary syndromes.

NOTE:
This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinicians judgment or to establish a protocol for all patients with a particular condition.
4. Antiplatelet Agents:
   a. Use aspirin therapy (75-162 mg/day) as a secondary prevention for those with diabetes and a history of ASCVD.
   b. If the patient has a documented aspirin allergy and ASCVD, clopidogrel (75mg/day) may be used.
   c. Dual antiplatelet therapy is reasonable for up to 1 year after an acute coronary syndrome.
   d. Consider aspirin therapy as a primary prevention strategy for those with diabetes at increased cardiovascular risk (family history of premature ASCVD, hypertension, smoking, dyslipidemia, or albuminuria) and not at increased risk of bleeding.

F. Coronary Heart Disease:
1. Patients with prior myocardial infarction should be continued on beta blockers for at least 2 years after the event.
2. For those with known ASCVD, use aspirin and statin therapy if not contraindicated, and consider ACE therapy as necessary.
3. For those with symptomatic heart failure, do not use thiazolidinedione.

G. Microvascular Complications and Foot Care:
1. Diabetic Kidney Disease (DKD): Screening for nephropathy is also a component of HEDIS
   a. Assess urinary albumin and eGFR annually (this applies to patients with type 2 diabetes, patients with comorbid hypertension, and type 1 diabetes with a duration of ≥5 years).
   b. Optimize glucose control and blood pressure control to reduce risk or slow the progression.
   c. For patients (non-pregnant) with diabetes and HTN, either and ACE or and ARB is recommended for those with modestly elevated UACR (30-299 mg/g creatinine) and is strongly recommended for those with UACR >300mg/g creatinine.
   d. Blood pressure levels <140/90 are recommended to reduce CVD mortality and slow chronic kidney disease progression.

### Management of Chronic Kidney Disease:

<table>
<thead>
<tr>
<th>GFR (mL/min/1.73m²)</th>
<th>Recommended Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Patients</td>
<td>Yearly measurement of creatinine, UACR, potassium</td>
</tr>
<tr>
<td>45-60</td>
<td>Referral to a nephrologist if possibility for nondiabetic kidney disease exists; consider need for dose adjustment of medication; monitor eGFR every 6 months; monitor electrolytes, bicarbonate, hemoglobin, calcium, phosphorus, and parathyroid hormone at least yearly; assure vitamin D sufficiency; consider bone density testing; referral for dietary counseling</td>
</tr>
</tbody>
</table>

**NOTE:**
This guideline is designed to assist providers by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinicians judgment or to establish a protocol for all patients with a particular condition.
2. Diabetic Retinopathy: Optimize glycemic control, blood pressure, and serum lipid control can reduce risk/slow progression. Retinal Eye Exam is a component of the HEDIS measurement. Fundus photographs are a screening tool, not a substitute for a comprehensive exam. If utilizing eye camera-interpretation of images is to be completed by a trained eye care provider.

Screening for Diabetic Retinopathy:

<table>
<thead>
<tr>
<th>Population</th>
<th>Exam/Finding</th>
<th>Timeframe</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adults with Type 1 Diabetes</td>
<td>Initial dilated and comprehensive eye exam by an ophthalmologist or optometrist</td>
<td>Within 5 years after onset of diabetes</td>
</tr>
<tr>
<td>Patients with Type 2 Diabetes</td>
<td>Initial dilated and comprehensive eye examination by an ophthalmologist or optometrist</td>
<td>At the time of the diabetes diagnosis</td>
</tr>
<tr>
<td>All diabetic patients after initial exam</td>
<td>no evidence of retinopathy for one or more annual exams</td>
<td>Exams every 2 years may be considered</td>
</tr>
<tr>
<td>All diabetic patients after initial exam or with abnormal findings</td>
<td>Any evidence of diabetic retinopathy present =&gt;dilated retinal exam</td>
<td>Dilated retinal exam repeated annually by an ophthalmologist or optometrist</td>
</tr>
<tr>
<td></td>
<td>Retinopathy that is progressing or sight-threatening</td>
<td>Requires more frequent examinations/monitoring</td>
</tr>
</tbody>
</table>

*Consider a referral to ophthalmologist specializing in retinopathy with signs of any macular edema, or retinopathy

3. Neuropathy:
   a. Tight glycemic control is the only method shown to prevent/delay diabetic neuropathy in Type 1 diabetics, and to slow progression of diabetic neuropathy in Type 2 patients.
   b. Assessment and Screening: All patients should be assessed for diabetic peripheral neuropathy (DPN) starting at diagnosis of type 2 diabetes and 5 years after the diagnosis of type 1 diabetes. Annual assessment thereafter.

Assessment for distal symmetric polyneuropathy should include history and assessment of either temperature or pinprick sensation and vibration sensation using a 128-Hz tuning fork. All patients should have annual 10-
g monofilament testing to identify feet at risk of ulceration and amputation. Treatment can include pregabalin, or duloxetine.

4. Foot Care:
   a. An annual comprehensive foot exam will identify risk factors for ulcers and amputations.
   b. The annual exam should include: inspection of the skin, assessment of foot deformities, neurological assessment (10-g monofilament testing), and vascular assessment, including pulses in legs and feet.
   c. Obtain a history of ulceration, amputation, Charcot foot, angioplasty or vascular surgery, cigarette smoking, retinopathy, and renal disease. Also assess current symptoms of neuropathy and vascular disease.
   d. Provide general preventive foot self-care education including, footwear selection/behaviors, and home care.

H. Older Adults: Generally, older adults (≥65 years) who are functional, cognitively intact, and with a long life expectancy have the same treatment goals as younger adults. Older adults have a higher risk of premature death, coexisting illnesses, depression and geriatric syndromes, including neurocognitive impairment. The ADA consensus report “Diabetes in Older Adults” contains further details.

   1. Consider the assessment of medical, functional, mental, and social geriatric domains for diabetes management in older adults to provide a framework to determine targets and therapeutic approaches.
   2. Screening for geriatric syndromes may be appropriate in older adults experiencing limitations in their basic and instrumental activities of daily living as they may affect diabetes self-management and be related to health-related quality of life.
   3. Screening for diabetes complications should be individualized in older adults. Pay close attention to complications that lead to functional impairment.
   4. Glycemic levels may be relaxed in older adults based on individual criteria.
   5. Annual screening for early detection of mild cognitive impairment or dementia for those 65 years and older.
   7. Hypoglycemia should be avoided. Assess and manage by adjusting targets as necessary.
   8. Persons who use continuous glucose monitoring and insulin pumps should continue with access as applicable after age 65.
